EXP-11: Deploying Zoho Creator App to Production

Aim

To understand and execute the deployment lifecycle of the Gym Membership Enrollment application in Zoho Creator, moving components from the Development Environment to the Live Production Environment safely and efficiently.

Overview

Zoho Creator provides separate environments for developing, testing, and running applications. For the Gym Membership Enrollment Form, deployment helps ensure that forms, member details, membership plans, reports, and workflows are tested before being made available to actual users.

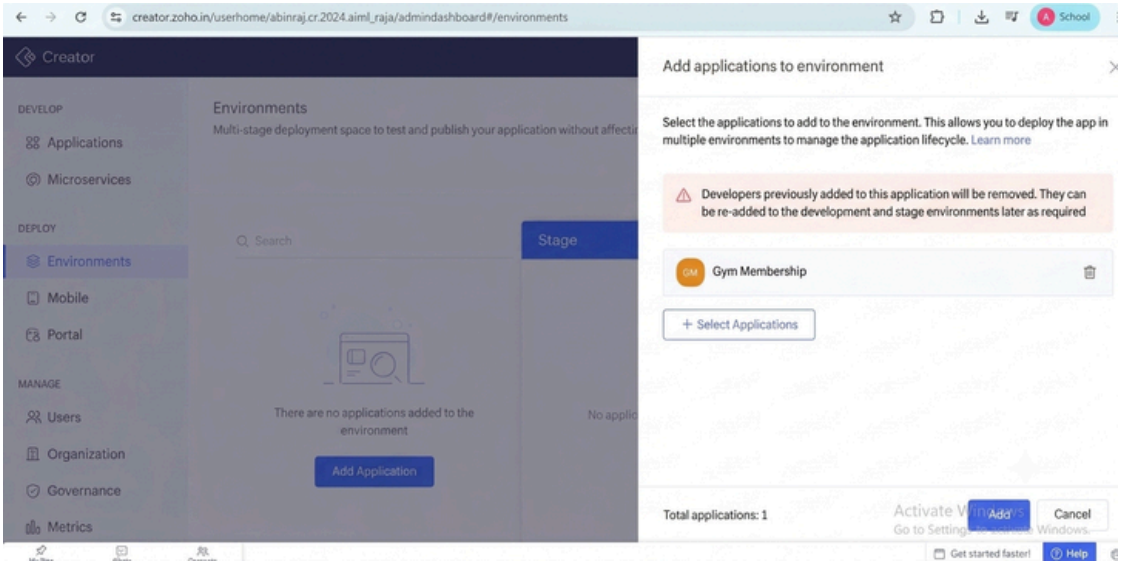

Environment	Purpose and Operational Rules
Development (Sandbox)	Used to build and test the Gym Membership Enrollment Form, member details, membership plans, Deluge scripts, and workflows without affecting live data.
Production (Live)	The live environment used by gym staff to manage member registrations, membership information, renewal details, and related records.
Migration and Publish	The controlled process of moving tested forms, fields, reports, workflows, and configurations from Development to Production.

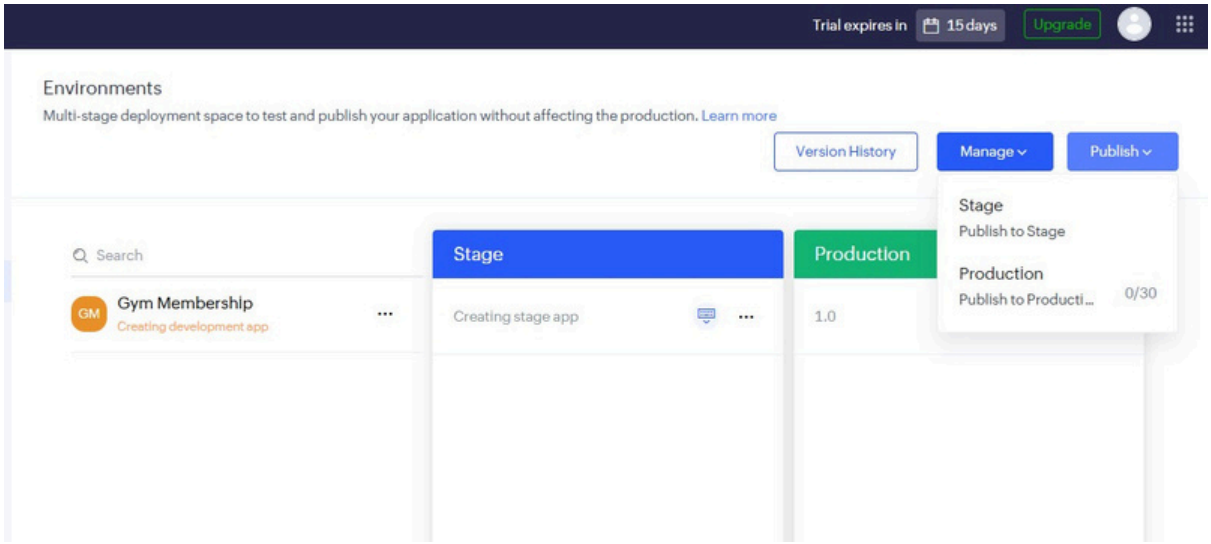

Procedure

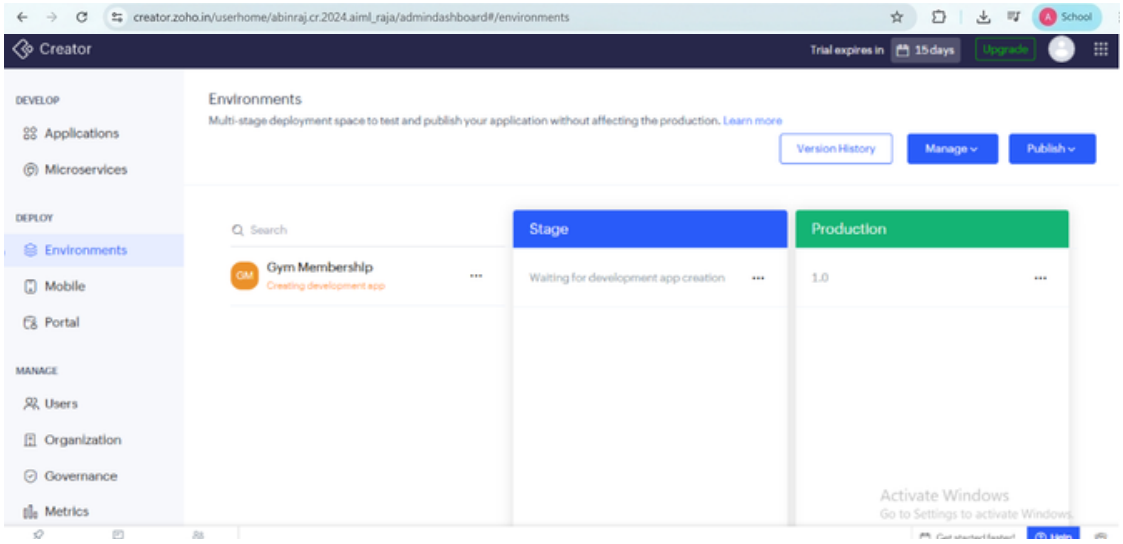

1. Pre-Deployment Validation: Open the Gym Membership Enrollment application in the Zoho Creator development workspace. Verify that the enrollment form, membership fields, reports, Deluge scripts, and workflow triggers function correctly.
2. Initiating Migration: Navigate to the deployment manager or relevant settings in Zoho Creator. Select the available option to migrate or publish the tested application components to the production environment.
3. Reviewing Schema and Component Changes: Review the comparison report provided by Zoho Creator. Check newly added fields, modified form structures, updated reports, and changes to workflow scripts before proceeding.
4. Testing the Production Application: After deployment, verify that the Gym Membership Enrollment Form opens correctly and that authorized users can access the required forms and reports.
5. Verifying Data and Permissions: Confirm that membership records, access permissions, and workflow settings behave as expected in the production

environment. Ensure that sensitive member information is accessible only to authorized users.

Result

The deployment lifecycle of the Gym Membership Enrollment application in Zoho Creator was studied. The experiment highlights the importance of testing application components, reviewing changes, verifying permissions, and checking the production environment before releasing the application to gym staff and members.
